RoxygenNote 6.1.1

R topics documented:

Annual_Max   *Generate annual maximum series*

Description

Extract annual maximum in years with over a user-defined proportion of non-missing values.

Usage

```
Annual_Max(Data_Detrend, Complete_Prop = 0.8)
```

Arguments

Complete_Prop   Minimum proportion of non-missing values in an annual record for the annual
                 maximum to be extracted. Default is `0.8`.

Data   Data frame containing two columns. In column:

- 1 A `"Date"` object of equally spaced discrete time steps.
- 2 Numeric vector containing corresponding time series values.

Value

List comprising the index of the annual maximum `Event` and the annual maximum values `AM`.

Examples

```
Annual_Max(Data=S20_T_MAX_Daily_Completed_Detrend$Detrend)
```

Con_Sampling_2D   *Conditionally sampling a two-dimensional dataset*

Description

Creates a data frame where the declustered excesses of a (conditioning) variable are paired with co-occurences of another variable.

Usage

```
Con_Sampling_2D(Data_Detrend, Data_Declust, Con_Variable, Thres = 0.97)
```

Arguments

Data_Detrend	Data frame containing two at least partially concurrent time series, detrended if necessary. Time steps must be equally spaced, with missing values assigned NA. First object may be a "Date" object. Can be Dataframe_Combine output.
Data_Declust	Data frame containing two (independently) declustered at least partially concurrent time series. Time steps must be equally spaced, with missing values assigned NA. Columns must be in the same order as in Data_Detrend. First object may be a "Date" object. Can be Dataframe_Combine output.
Con_Variable	Column number (1 or 2) or the column name of the conditioning variable. Default is 1.
Thres	Threshold, as a quantile of the observations of the conditioning variable. Default is 0.97.

Value

List comprising the specified Threshold as the quantile of the conditioning variable above which declustered excesses are paired with co-occurences of the other variable, the resulting two-dimensional sample data and name of the conditioning variable.

Examples

```
S20.Rainfall<-Con_Sampling_2D(Data_Detrend=S20.Detrend.df[,-c(1,4)],
                        Data_Declust=S20.Detrend.Declustered.df[,-c(1,4)],
                        Con_Variable="Rainfall",Thres=0.97)
```

Con_Sampling_2D_Lag   *Conditionally sampling a two dimensional dataset*

Description

Creates a data frame where the declustered excesses of a (conditioning) variable are paired with the maximum value of a second variable over a specified lag.

Usage

```
Con_Sampling_2D_Lag(Data_Detrend, Data_Declust, Con_Variable,
  Thres = 0.97, Lag_Backward = 0, Lag_Forward = 0)
```

Arguments

Data_Detrend	Data frame containing two at least partially concurrent time series, detrended if necessary. Time steps must be equally spaced, with missing values assigned NA. First object may be a "Date" object. Can be Dataframe_Combine output.
Data_Declust	Data frame containing two (independently) declustered at least partially concurrent time series. Time steps must be equally spaced, with missing values assigned NA. Columns must be in the same order as in Data_Detrend. First object may be a "Date" object. Can be Dataframe_Combine output.
Con_Variable	Column number (1 or 2) or the column name of the conditioning variable. Default is 1.
Thres	Threshold, as a quantile of the observations of the conditioning variable. Default is 0.97.
Lag_Backward	Positieve lag applied to variable not assigned as the Con_Variable. Default is 0
Lag_Forward	Negative lag to variable not assigned as the Con_Variable. Default is 0

Value

List comprising the specifyied Threshold as the quantile of the conditioning variable above which declustered excesses are paired with co-occurences of the other variable, the resulting two-dimensional sample data and name of the conditioning variable.

Examples

```
S20.Rainfall<-Con_Sampling_2D(Data_Detrend=S20.Detrend.df[,-c(1,4)],
                      Data_Declust=S20.Detrend.Declustered.df[,-c(1,4)],
                      Con_Variable="Rainfall",Thres=0.97)
```

Cooley19	*Derives bivariate isolines using the non-parametric approach of Cooley et al. (2019).*

Description

The Cooley et al. (2019) method exploits bivariate regular variation and kernel density estimation to generate isolines of bivariate exceedance probabilities. The function utilizes the ks and texmex packages, and works for both asymptotic dependence and independence.

Usage

```
Cooley19(Data, Migpd, p.base = 0.01, p.proj = 0.001, u = 0.95,
  PLOT = FALSE, x_lim_min_T = NA, x_lim_max_T = NA,
  y_lim_min_T = NA, y_lim_max_T = NA, x_lim_min = NA,
  x_lim_max = NA, y_lim_min = NA, y_lim_max = NA)
```

Arguments

Data	Data frame consisting of two columns.
Migpd	An Migpd object, containing the generalized Pareto models fitted (independently) to the variables comprising the columns of Data.
p.base	Numeric vector of length one specifying the exceedance probability of the base isoline. Default is 0.01.
p.proj	Numeric vector of length one specifying the exceedance probability of the projected isoline. Default is 0.001.
u	Numeric vector of length one specifying the quantile at which to estimate the asymptotic nature of the data i.e. chi and chibar. Default is 0.95.
PLOT	Logical; indicating whether to plot the base and projected isolines on the original and transformed scale. Default is FALSE.
x_lim_min_T	Numeric vector of length one specifying the lower x-axis limit of the transformed scale plot. Default is NA.
x_lim_max_T	Numeric vector of length one specifying the upper x-axis limit of the transformed scale plot. Default is NA.
y_lim_min_T	Numeric vector of length one specifying the lower y-axis limit of the transformed scale plot. Default is NA.
y_lim_max_T	Numeric vector of length one specifying the upper y-axis limit of the transformed scale plot. Default is NA.
x_lim_min	Numeric vector of length one specifying the lower x-axis limit of the plot on the original scale. Default is NA.
x_lim_max	Numeric vector of length one specifying the upper x-axis limit of the plot on the original scale. Default is NA.
y_lim_min	Numeric vector of length one specifying the lower y-axis limit of the plot on the original scale. Default is NA.
y_lim_max	Numeric vector of length one specifying the lower y-axis limit of the plot on the original scale. Default is NA.

Value

List comprising a description of the type of (asymptoptic) dependence Asym, the values the extremal dependence measures Chi and n.bar, exceedance probabilities of the base p.base and projected p.proj isolines, as well as the points on the base I.base and projected I.proj isolines.

Cooley19(Data=na.omit(S20.Detrend.df[,3:4]),Migpd=s.Migpd,
p.base=0.01,p.proj=0.001,PLOT=TRUE,x_lim_max_T=500,y_lim_max_T=500)
```

Copula_Threshold_2D   *Copula Selection With Threshold 2D - Fit*

Description

Declustered excesses of a (conditioning) variable are paired with co-occurences of the other variable before the best fitting bivariate copula is selected, using `BiCopSelect` function in the `VineCopula` package, for a single or range of thresholds. The procedure is automatically repeated with the variables switched.

Usage

```
Copula_Threshold_2D(Data_Detrend, Data_Declust, Thres = seq(0.9, 0.99,
  0.01), x_lim_min = min(Thres), x_lim_max = max(Thres),
  y_lim_min = -1, y_lim_max = 1, Upper = 0, Lower = 0,
  GAP = 0.05, Legend = TRUE)
```

Arguments

Data_Detrend	Data frame containing two at least partially concurrent time series, detrended if necessary. Time steps must be equally spaced, with missing values assigned NA.
Data_Declust	Data frame containing two (independently) declustered at least partially concurrent time series. Time steps must be equally spaced, with missing values assigned NA.
Thres	A single or sequence of thresholds, given as a quantile of the observations of the conditioning variable. Default, sequence from 0.9 to 0.99 at intervals of 0.01.
x_lim_min	Numeric vector of length one specifying x-axis minimum. Default is the maximum argument in Thres.
x_lim_max	Numeric vector of length one specifying x-axis maximum. Default is the minimum argument in Thres.
y_lim_min	Numeric vector of length one specifying y-axis minimum. Default -1.0.
y_lim_max	Numeric vector of length one specifying y-axis maximum. Default 1.0.
Upper	Numeric vector specifying the element number of the Thres argument for which the copula family name label to appear above the corresponding point on the Kendall's tau coefficient vs threshold plot, when conditioning on the variable in column 1. Default is 0.
Lower	Numeric vector specifying the element number of the Thres argument for which the copula family name label to appear below the corresponding point on the Kendall's tau coefficient vs threshold plot, when conditioning on the variable in column 2. Default is 0.
GAP	Numeric vector of length one specifying the distance above or below the copula family name label appears the corresponding point on the Kendall's tau coefficient vs threshold plot. Default is 0.05.
Legend	Logic vector of length one specifying whether a legend should be plotted. Default is TRUE.

Value

List comprising:

- Kendalls_Tau_Var1 Kendall's tau of a sample
- p_value_Var1 p-value when testing the null hypothesis H_0: tau=0 i.e. that there is no correlation between the variables
- N_Var1 Size of the dataset
- Copula_Family_Var1 Best fitting copula for the specified thresholds

when the dataset is conditioned on the variable in column 1. Analogous vectors Kendalls_Tau_Var2, p_value_Var2, N_Var2 and Copula_Family_Var2 for the specified thresholds when the dataset is conditioned on the variable in column 2.

                    y_lim_min=-0.075, y_lim_max =0.25,
                    Upper=c(6,8), Lower=c(6,8),GAP=0.1)
```

Copula_Threshold_2D_Lag
Copula Selection With Threshold 2D - Fit

Description

Declustered excesses of a (conditioning) variable are paired with co-occurences of the other variable before the best fitting bivariate copula is selected, using BiCopSelect function in the VineCopula package, for a single or range of thresholds. The procedure is automatically repeated with the variables switched.

Usage

```
Copula_Threshold_2D_Lag(Data_Detrend, Data_Declust, Thres1 = seq(0.9,
  0.99, 0.01), Thres2 = seq(0.9, 0.99, 0.01), Lag_Backward_Var1,
  Lag_Forward_Var1, Lag_Backward_Var2, Lag_Forward_Var2,
  x_lim_min = min(c(Thres1, Thres2)), x_lim_max = max(c(Thres1,
  Thres2)), y_lim_min = -1, y_lim_max = 1, Upper = 0, Lower = 0,
  GAP = 0.05, Legend = TRUE)
```

Arguments

Data_Detrend	Data frame containing two at least partially concurrent time series, detrended if necessary. Time steps must be equally spaced, with missing values assigned NA.
Data_Declust	Data frame containing two (independently) declustered at least partially concurrent time series. Time steps must be equally spaced, with missing values assigned NA.

Lag_Backward_Var1

                  Numeric vector of length one specifying the negative lag applied to variable in the first column of `Data_Detrend`. Default `0`.

Lag_Forward_Var1

                  Numeric vector of length one specifying positive lag applied to variable in the first column of `Data_Detrend`. Default `0`.

Lag_Backward_Var2

                  Numeric vector of length one specifying negative lag applied to variable in the second column of `Data_Detrend`. Default `0`.

Lag_Forward_Var2

                  Numeric vector of length one specifying positive lag applied to variable in the second column of `Data_Detrend`. Default `0`.

x_lim_min   Numeric vector of length one specifying x-axis minimum. Default is the maximum argument in `Thres`.

x_lim_max   Numeric vector of length one specifying x-axis maximum. Default is the minimum argument in `Thres`.

y_lim_min   Numeric vector of length one specifying y-axis minimum. Default `-1.0`.

y_lim_max   Numeric vector of length one specifying y-axis maximum. Default `1.0`.

Upper   Numeric vector specifying the element number of the `Thres` argument for which the copula family name label to appear above the corresponding point on the Kendall's tau coefficient vs threshold plot, when conditioning on the variable in column 1. Default is `0`.

Lower   Numeric vector specifying the element number of the `Thres` argument for which the copula family name label to appear below the corresponding point on the Kendall's tau coefficient vs threshold plot, when conditioning on the variable in column 2. Default is `0`.

GAP   Numeric vector of length one specifying the distance above or below the copula family name label appears the corresponding point on the Kendall's tau coefficient vs threshold plot. Default is `0.05`.

Legend   Logic vector of length one specifying whether a legend should be plotted. Default is `TRUE`.

Thres   A single or sequence of thresholds, given as a quantile of the observations of the conditioning variable. Default, sequence from `0.9` to `0.99` at intervals of `0.01`.

Value

List comprising:

- `Kendalls_Tau_Var1` Kendall's tau of a sample
- `p_value_Var1` p-value when testing the null hypothesis $H\_0=0$ i.e. that there is no correlation between the variables
- `N_Var1` size of the dataset
- `Copula_Family_Var1` best fitting copula for the specified thresholds

when the dataset is conditioned on the variable in column 1. Analogous vector `Kendalls_Tau_Var2`, `p_value_Var2`, `N_Var2` and `Copula_Family_Var2` for the specified thresholds when the dataset is conditioned on the variable in column 2.

```

Dataframe_Combine   *Creates a data frame containing up to five time series*

Description

Combines up to five time series, detrended where necessary, into a single data frame.

Usage

```
Dataframe_Combine(data.1, data.2, data.3, data.4 = 0, data.5 = 0,
  n = 3, names)
```

Arguments

n   Integer 1-5 specifying the number of time series. Default is 3.

data.1:5   Data frames with two columns containing in column

- 1 - Continuous sequence of times spanning from the first to the final recorded observations.
- 2 - Corresponding values detrended where necessary.

Value

A data frame containing all times from the first to the most up to date reading of any of the variables.

S20.OsWL.df$Date<-as.Date(S20.OsWL.df$Date)
#Detrending O-sWL series at Site S20
S20.OsWL.Detrend<-Detrend(Data=S20.OsWL.df,Method = "window",PLOT=FALSE,
                          x_lab="Date",y_lab="O-sWL (ft NGVD 29)")
#Creating a dataframe with the date alongside the detrended OsWL series
S20.OsWL.Detrend.df<-data.frame(as.Date(S20.OsWL.df$Date),S20.OsWL.Detrend)
colnames(S20.OsWL.Detrend.df)<-c("Date","OsWL")
#Combining the two datasets by Date argument
S20.Detrend.df<-Dataframe_Combine(data.1<-S20.Rainfall.df,
                                  data.2<-S20.OsWL.Detrend.df,
                                  data.3=0,
                                  names=c("Rainfall","OsWL"))
```

Decluster   *Declusters a time series*

Description

Identify cluster maxima above a threshold, using the runs method of Smith and Weissman (1994).

Usage

```
Decluster(Data, u = 0.95, SepCrit = 3, mu = 365.25)
```

Arguments

Data   Numeric vector of the time series.

u   Numeric vector of length one specifying the declustering threshold; as a quantile
                [0,1] of Data vector. Default is 0.95.

SepCrit   Integer; specifying the separation criterion under which events are declustered.
                Default is 3 corresponding to a storm window of three days in the case of daily
                data.

mu   (average) occurrence frequency of events in Data. Numeric vector of length
                one. Default is 365.25, daily data.

Value

List comprising the Threshold above which cluster maxima are identified, rate of cluster maxima
Rate, a vector containing the original time series Detrended and the Declustered series.

Examples

```
Decluster(data=S20_T_MAX_Daily_Completed_Detrend$Detrend)
```

Design_Event_2D   *Derives a single or ensemble of bivariate design events*

Description

Calculates the single design event under the assumption of full dependence, or once accounting for
dependence between variables the single "most-likely" or an ensemble of possible design events.

Usage

```
Design_Event_2D(Data, Data_Con1, Data_Con2, Thres1, Thres2, Copula_Family1,
  Copula_Family2, Marginal_Dist1, Marginal_Dist2, Con1 = "Rainfall",
  Con2 = "OsWL", mu = 365.25, RP, x_lab = "Rainfall (mm)",
  y_lab = "O-sWL (mNGVD 29)", x_lim_min = NA, x_lim_max = NA,
  y_lim_min = NA, y_lim_max = NA, delta = 1e-04, N, N_Ensemble)
```

Arguments

Data	Data frame of dimension nx2 containing two co-occurring time series of length n.
Data_Con1	Data frame containing the conditional sample (declustered excesses paired with concurrent values of other variable), conditioned on the variable in the first column.
Data_Con2	Data frame containing the conditional sample (declustered excesses paired with concurrent values of other variable), conditioned on the variable in the second column. Can be obtained using the Con_Sampling_2D function.
Thres1	Numeric vector of length one specifying the threshold above which the variable in the first column was sampled in Data_Con1.
Thres2	Numeric vector of length one specifying the threshold above which the variable in the second column was sampled in Data_Con2.
Copula_Family1	Numeric vector of length one specifying the copula family used to model the Data_Con1 dataset.
Copula_Family2	Numeric vector of length one specifying the copula family used to model the Data_Con2 dataset. Best fitting of 40 copulas can be found using the Copula_Threshold_2D function.
Marginal_Dist1	Character vector of length one specifying (non-extreme) distribution used to model the marginal distribution of the non-conditioned variable.
Marginal_Dist2	Character vector of length one specifying (non-extreme) distribution used to model the marginal distribution of the non-conditioned variable.
Con1	Character vector of length one specifying the name of variable in the first column of Data.
Con2	Character vector of length one specifying the name of variable in the second column of Data.
mu	Numeric vector of length one specifying the (average) occurrence frequency of events in Data. Default is 365.25, daily data.
RP	Numeric vector of length one specifying the return period of interest.
x_lab	Character vector specifying the x-axis label.
y_lab	Character vector specifying the y-axis label.
x_lim_min	Numeric vector of length one specifying x-axis minimum. Default is NA.
x_lim_max	Numeric vector of length one specifying x-axis maximum. Default is NA.
y_lim_min	Numeric vector of length one specifying y-axis minimum. Default is NA.
y_lim_max	Numeric vector of length one specifying y-axis maximum. Default is NA.
delta	Numeric vector of length one specifying of the resolution at which the copula CDF is evaluated on the [0,1]2 square. Default is 0.0001.
N	Numeric vector of length one specifying the size of the sample from the fitted joint distributions used to estimate the density along an isoline. Samples are collected from the two joint distribution with proportions consistent with the total number of extreme events conditioned on each variable.
N_Ensemble	Numeric vector of length one specifying the number of possible design events sampled along the isoline of interest.

Value

Plot of all the observations (grey circles) as well as the declustered excesses above Thres1 (blue circles) or Thres2 (blue circles), observations may belong to both conditional samples. Also shown is the isoline associated with RP contoured according to their relative probability of occurrence on the basis of the sample from the two joint distributions, the "most likely" design event (black diamond), and design event under the assumption of full dependence (black triangle) are also shown in the plot. The function also returns a list comprising the design events assuming full dependence ″FullDependence″, as well as once the dependence between the variables is accounted for the "Most likley" "MostLikelyEvent" as well as an "Ensemble" of possible design events.

```

Detrend   *Detrends a time series.*

Description

Detrends a time series using either a linear fit covering the entire dataset or moving average trend correction with a user-specified window width.

Usage

```
Detrend(Data, Method = ″window″, Window_Width = 89,
  End_Length = 1826, PLOT = FALSE, x_lab = ″Data″, y_lab = ″Data″)
```

Arguments

`Data`	Data frame containing two columns. In column:

- 1 A `"Date"` object of equally spaced discrete time steps.
- 2 Numeric vector containing corresponding time series values. No NAs allowed.

`Method`	Character vector of length one specifying approach used to detrend the data. Options are moving average `"window"` (default) and `"linear"`.
`Window_Width`	Numeric vector of length one specifying length of the moving average window. Default is 89, window comprises the observation plus 44 days either side, which for daily data corresponds to an approximate 3 month window.
`End_Length`	Numeric vector of length one specifying number of observations at the end of the time series used to calculate the present day average. Default is 1826, which for daily data corresponds to the final five years of observations.
`PLOT`	Logical; whether to plot original and detrended series. Default is `"FALSE"`.
`x_lab`	Character vector of length one specifying x-axis label. Default is `"Date"`.
`y_lab`	Character vector of length one specifying y-axis label. Default is `"Data"`.

Value

Numeric vector of the detrended time series.

Examples

```
#Detrending ocean-side water level at site S22 using a 3 month moving average window and the last
#five years of observations to calculate the present day average.
Detrend(S22_T_MAX_Daily_Completed_Detrend,Method = "window",Window_Width= 89,
        End_Length = 1826, PLOT=FALSE,x_lab="Data",y_lab="Data")
```

`Diag_Non_Con`	*Goodness of fit of non-extreme marginal distributions*

Description

Fits two (unbounded) non-extreme marginal distributions to a dataset and returns three plots demonstrating their relative goodness of fit.

Usage

```
Diag_Non_Con(Data, x_lab, y_lim_min = 0, y_lim_max = 1)
```

Arguments

`Data`	Numeric vector containing realizations of the variable of interest.
`x_lab`	Character vector of length one specifying the label on the x-axis of histogram and cumulative distribution plot.
`y_lim_min`	Numeric vector of length one specifying the lower y-axis limit of the histogram. Default is `0`.
`y_lim_max`	Numeric vector of length one specifying the upper y-axis limit of the histogram. Default is `1`.

Value

Name of the best fitting distribution `Best_fit`. Panel consisting of three plots. Upper plot: Plot depicting the AIC of the two fitted distributions. Middle plot: Probability Density Functions (PDFs) of the fitted distributions superimposed on a histogram of the data. Lower plot: Cumulative Distribution Functions (CDFs) of the fitted distributions overlaid on a plot of the empirical CDF.

             y_lim_min=0,y_lim_max=1.5)
```

`Diag_Non_Con_Sel`	*Demonstrate the goodness of fit of the selected non-extreme marginal distribution*

Description

Plots demonstrating the goodness of fit of a selected (not truncated) non-extreme marginal distribution to a dataset.

Usage

```
Diag_Non_Con_Sel(Data, x_lab = "Data", y_lim_min = 0, y_lim_max = 1,
  Selected)
```

Arguments

`Data`	Numeric vector containing realizations of the variable of interest.
`x_lab`	Numeric vector of length one specifyingLabel on the x-axis of histogram and cummulative distribution plot.
`y_lim_min`	Numeric vector of length one specifying the lower y-axis limit of the histogram.
`y_lim_max`	Numeric vector of length one specifying the upper y-axis limit of the histogram.
`Selected`	Charactor vector of length one specifying the chosen distribution, options are the Gaussian `"Gaus"` and logistic `"Logis"`.

Value

Panel consisting of three plots. Upper plot: Plots depicting the AIC of the two fitted distributions. Middle plot: Probabilty Density Functions (PDFs) of the `selected` distribtions superimposed on a histgram of the data. Lower plot: Cummulative distribution function (CDFs) of the `selected` distribution overlaid on a plot of the empirical CDF.

```

Diag_Non_Con_Trunc   *Goodness of fit of non-extreme marginal distributions*

Description

Fits seven (truncated) non-extreme marginal distributions to a dataset and returns three plots demonstrating their relative goodness of fit.

Usage

```
Diag_Non_Con_Trunc(Data, x_lab, y_lim_min = 0, y_lim_max = 1)
```

Arguments

Data	Numeric vector containing realizations of the variable of interest.
x_lab	Character vector of length one specifying the label on the x-axis of histogram and cumulative distribution plot.
y_lim_min	Numeric vector of length one specifying the lower y-axis limit of the histogram. Default is 0.
y_lim_max	Numeric vector of length one specifying the upper y-axis limit of the histogram. Default is 1.

Value

Name of the best fitting distribution Best_fit. Panel consisting of three plots. Upper plot: Plot depicting the AIC of the eight fitted distributions. Middle plot: Probability Density Functions (PDFs) of the fitted distributions superimposed on a histogram of the data. Lower plot: Cumulative Distribution Functions (CDFs) of the fitted distributions overlaid on a plot of the empirical CDF.

Description

Plots demonstrating the goodness of fit of a selected (truncated) non-extreme marginal distribution
to a dataset.

Usage

```
Diag_Non_Con_Trunc_Sel(Data, x_lab, y_lim_min = 0, y_lim_max = 1,
  Selected)
```

Arguments

Data	Numeric vector containing realizations of the variable of interest.
x_lab	Character vector of length one specifying the label on the x-axis of histogram and cummulative distribution plot.
y_lim_min	Numeric vector of length one specifying the lower y-axis limit of the histogram. Default is 0.
y_lim_max	Numericr vector of length one specifying the upper y-axis limit of the histogram. Default is 1.
Selected	Character vector of length one specifying the chosen distribution, options are the Birnbaum-Saunders "BS", exponential "Exp", gamma "Gam", lognormal "LogN", Tweedie "Twe" and Weibull "Weib".

Value

Panel consisting of three plots. Upper plot: Plot depicting the AIC of the eight fitted distributions.
Middle plot: Probability Density Functions (PDFs) of the fitted distributions superimposed on a histogram of the data. Lower plot: Cumulative Distribution Functions (CDFs) of the fitted distributions
overlaid on a plot of the empirical CDF.

GPD_Fit   *Fits a single generalized Pareto distribution - Fit*

Description

Fit a Generalized Pareto Distribution (GPD) to a declustered dataset.

Usage

```
GPD_Fit(Data, Data_Full, u = 0.95, mu = 365.25, min.RI = 1,
  PLOT = FALSE, xlab_hist = "Data", y_lab = "Data")
```

Arguments

Data	Numeric vector containing the declusted data.
Data_Full	Numeric vector containing the non-declustered data.
u	GPD threshold; as a quantile [0,1] of Data vector. Default is 0.95.
mu	Numeric vector of length one specifying (average) occurrence frequency of events in the Data_Full input. Default is 365.25.
min.RI	Numeric vector of length one specifying the minimum return period in the return level plot. Default is 1.
xlab_hist	Character vector of length one. Histogram x-axis label. Default is "Data".
y_lab	Character vector of length one. Histogram x-axis label. Default is "Data".
Plot	Logical; indicating whether to plot diagnostics. Default is FALSE.

Value

List comprising the GPD Threshold, shape parameter xi and scale parameters sigma along with their standard errors sigma.SE and xi.SE.

Details

For excesses of a variable X over a suitably high threshold u the fitted GPD model is parameterized as follows:

$$P(X > x | X > u) = \left[1 + \xi \frac{(x - u)}{\sigma} \right]_+^{-\frac{1}{\xi}}$$

where ξ and $\sigma > 0$ are the shape and scale parameters of the GPD and $[y]_+ = max(y, 0)$.

Examples

```
Decluster(Data=S20_T_MAX_Daily_Completed_Detrend$Detrend)
```

```
GPD_Parameter_Stability_Plot
```
GPD parameter stability plots

Description

Plots showing the stability of the GPD scale and shape parameter estimates across a specified range of thresholds.

Usage

```
GPD_Parameter_Stability_Plot(Data, Data_Full, u = 0.95, PLOT = FALSE,
  xlab_hist = "Data", y_lab = "Data")
```

Arguments

Data	Numeric vector containing the declusted data.
Data_Full	Numeric vector containing the non-declustered data.
u	Numeric vector of GPD thresholds; given as a quantiles [0,1] of Data vector. Default is 0.9 to 0.999 in intervals of 0.001.
Plot	Logical; indicating whether to plot diagnostics. Default is FALSE.

Value

Plot of the shape and modified scale parameter estimates along with their errors bars over the range of specified thresholds.

See Also

Decluster

Examples

```

                        u=seq(0.9,0.999,0.001))
```

```
HT04
```
Fits and simulates from the conditional multivariate approach of Heffernan and Tawn (2004)

Description

Fitting and simulating the conditional multivariate approach of Heffernan and Tawn (2004) to a dataset comprising 3 variables. Function utilizes the mexDependence and predict.mex.conditioned functions from the texmex package.

Usage

```
HT04(data_Detrend_Dependence_df, data_Detrend_Declustered_df, u_Dependence,
  Migpd, mu = 365.25, N = 100, Margins = "gumbel", V = 10,
  Maxit = 10000)
```

Arguments

data_Detrend_Dependence_df

        A data frame with (n+1) columns, containing in column

- 1 - Continuous sequence of dates spanning the first to the final time of any of the variables are recorded.
- 2:(n+1) - Values, detrended where necessary, of the variables to be modelled.

data_Detrend_Declustered_df

        A data frame with (n+1) columns, containing in column

- 1 - Continuous sequence of dates spanning the first to the final time of any of the variables are recorded.
- 2:(n+1) - Declustered and if necessary detrended values of the variables to be modelled.

u_Dependence   Dependence quantile. Specifies the (sub-sample of) data to which the dependence model is fitted, that for which the conditioning variable exceeds the threshold associated with the prescribed quantile. Default is 0.7, thus the dependence parameters are estimated using the data with the highest 30% of values of the conditioning variables.

Migpd   An Migpd object, containing the generalized Pareto models fitted (independently) to each of the variables.

Margins   Character vector specifying the form of margins to which the data are transformed for carrying out dependence estimation. Default is "gumbel", alternative is "laplace". Under Gumbel margins, the estimated parameters a and b describe only positive dependence, while c and d describe negative dependence in this case. For Laplace margins, only parameters a and b are estimated as these capture both positive and negative dependence.

V   See documentation for mexDependence.

Maxit   See documentation for mexDependence.

Value

List comprising the fitted HT04 models Models, proportion of the time each variable is most extreme, given at least one variable is extreme Prop, as well as the simulated values on the transformed u.sim and original x.sim scales.

HT04_Lag   *Fits and simulates from the conditional multivariate approach of Hef-*
                                  fernan and Tawn (2004)

Description

Fitting and simulating the conditional multivariate approach of Heffernan and Tawn (2004) to a
dataset. Function utilizes the mexDependence and predict.mex.conditioned functions from the
texmex package.

Usage

```
HT04_Lag(data_Detrend_Dependence_df, data_Detrend_Declustered_df, Lags,
  u_Dependence, Migpd, mu = 365.25, N = 100, Margins = "gumbel",
  V = 10, Maxit = 10000)
```

Arguments

data_Detrend_Dependence_df

               A data frame with (n+1) columns, containing in column

- 1 - Continuous sequence of dates spanning the first to the final time of any
  of the variables are recorded.
- 2:(n+1) - Values, detrended where necessary, of the variables to be mod-
  elled.

data_Detrend_Declustered_df

               A data frame with (n+1) columns, containing in column

- 1 - Continuous sequence of dates spanning the first to the final time of any
  of the variables are recorded.
- 2:(n+1) - Declustered and if necessary detrended values of the variables to
  be modelled.

u_Dependence   Dependence quantile. Specifies the (sub-sample of) data to which the depen-
                 dence model is fitted, that for which the conditioning variable exceeds the thresh-
                 old associated with the prescribed quantile. Default is 0.7, thus the dependence
                 parameters are estimated using the data with the highest 30% of values of the
                 conditioning variables.

Migpd   An Migpd object, containing the parameterized Pareto models fitted (indepen-
                 dently) to each of the variables.

Margins	Character vector specifying the form of margins to which the data are transformed for carrying out dependence estimation. Default is "gumbel", alternative is "laplace". Under Gumbel margins, the estimated parameters a and b describe only positive dependence, while c and d describe negative dependence in this case. For Laplace margins, only parameters a and b are estimated as these capture both positive and negative dependence.
V	See documentation for mexDependence.
Maxit	See documentation for mexDependence.
Lag	Matrix specifying the lags. The no lag i.e. 0 lag cases need to be specified. Row n denotes the lags applied to the variable in the nth column of data_Detrend_Dependence_df. Column n corresponds to the nth largest lag applied to any variable. NA. Default is matrix(c(0,1,0,NA),nrow=2,byrow = T), which corresponds to a lag of 1 being applied to variable in the first column of data_Detrend_Dependence_df and no lag being applied to the variable in the second column of data_Detrend_Dependence_df.

Value

List comprising the fitted HT04 models `Models`, proportion of the time each variable is most extreme, given at least one variable is extreme `Prop`, as well as the simulated values on the transformed `u.sim` and original x.sim scales.

```

Imputation	*Imputing missing values through linear regression*

Description

Fits a simple linear regression model, impute missing values of the dependent variable.

Usage

```
Imputation(Data, Variable, x_lab, y_lab)
```

Arguments

Data	Data frame containing two at least partially concurrent time series. First column may be a "Date" object. Can be Dataframe_Combine output.
Variable	Character vector of length one specifying the (column) name of the variable to be imputed i.e. dependent variable in the fitted regression.
x_lab	Character vector of length one specifying the name of the independent variable to appear as the x-axis label on a plot showing the data, imputed values and the linear regression model.

y_lab   Character vector of length one specifying the name of the dependent variable
                        to appear as the y-axis label on plot showing the data, imputed values and the
                        linear regression model.

Value

List comprising a

- `Data` data frame containing the original data plus an additional column named `Value` where
  the NA values of the `Variable` of interest have been imputed where possible.

- `Model` linear regression model parameters including its coefficient of determination

and a scatter plot of the data (black points), linear regression model (red line) and fitted (imputed)
values (blue points).

Examples

```
####Objective: Fill in missing values at groundwater well G_3356 using record at G_3355
##Viewing first few rows of G_3356
head(G_3356)
#Converting date column to a "Date" object
G_3356$Date<-seq(as.Date("1985-10-23"), as.Date("2019-05-29"), by="day")
#Converting readings to numeric object
G_3356$Value<-as.numeric(as.character(G_3356$Value))

##Viewing first few rows of G_3355
head(G_3355)
#Converting date column to a "Date" object
G_3355$Date<-seq(as.Date("1985-08-20"), as.Date("2019-06-02"), by="day")
#Converting readings to numeric object
G_3355$Value<-as.numeric(as.character(G_3355$Value))

##Merge the two dataframes by date
library('dplyr')
GW_S20<-merge(G_3356,G_3355,by="Date")
colnames(GW_S20)<-c("Date","G3356","G3355")
#Carrying out imputation
Imputation(Data=GW_S20,Variable="G3356",
           x_lab="Groundwater level (ft NGVD 29)",
           y_lab="Groundwater level (ft NGVD 29)")
```

Kendall_Lag   *Kendall's tau correlation coefficient between pairs of variables over a*
                               range of lags

Description

Kendall's tau correlation coefficient between pairs of up to three variables over a range of lags

Usage

```
Kendall_Lag(Data, Lags = seq(-6, 6, 1), PLOT = TRUE, GAP = 0.1)
```

Arguments

Data	A data frame with 3 columns, containing concurrent observations of three time series.
Lags	Integer vector giving the lags over which to calculate coefficient. Default is a vector from -6 to 6.
GAP	Numeric vector of length one. Length of y-axis above and below max and min Kendall's tau values.
Plot	Logical; whether to show plot of Kendall's coefficient vs lag. Default is TRUE.

Value

List comprising Kendall's tau coefficients between the variables pairs composing columns of Data with the specified lags applied to the second named variable Values and the p-values Test when testing the null hypothesis H_0: tau=0 i.e. there is no correlation between a pair of variables. Plot of the coefficient with a filled point of hypothesis test (p-value<0.05). Lag applied to variable named second in the legend.

Mean_Excess_Plot	*Mean excess plot - GPD threshold selection*

Description

The empirical mean excess function is linear in the case of a GPD.

Usage

```
Mean_Excess_Plot(Data)
```

Arguments

data	A vector comprising a declustered and if necessary detrended time series to be modelled.

Value

Plot of the empirical mean excess function (black line), average of all observations exceeding a threshold decreased by the threshold, for thresholds spanning the range of the observations. Also provided are 95% confidence intervals (blue dotted lines) and the observations (black dots).

See Also

[Decluster](#) [Detrend](#)

Examples

Mean_Excess_Plot(Data=S20_Detrend_Declustered_df$Rainfall)
```

Migpd_Fit *Fits Multiple independent generalized Pareto models - Fit*

Description

Fit multiple independent generalized Pareto models to each column of a data frame. Edited version of the `migpd` function in `texmex`, to allow for NAs in a time series.

Usage

```
Migpd_Fit(Data, mth, mqu, penalty = "gaussian", maxit = 10000,
  trace = 0, verbose = FALSE, priorParameters = NULL)
```

Arguments

Data	A data frame with n columns, each comprising a declustered and if necessary detrended time series to be modelled.
mth	Marginal thresholds, above which generalized Pareto models are fitted. Numeric vector of length n.
mqu	Marginal quantiles, above which generalized Pareto models are fitted. **Only one of** mth **and** mqu **should be supplied.** Numeric vector of length n.
penalty	See [ggplot.migpd]().
maxit	See [ggplot.migpd]().
trace	See [ggplot.migpd]().
verbose	See [ggplot.migpd]().
priorParameters	
	See [ggplot.migpd]().

Value

An object of class "migpd". There are `coef`, `print`, `plot`, `ggplot` and `summary` functions available.

See Also

Examples

```
#With date as first column
S22.GPD<-Migpd_Fit(Data=S22.Detrend.Declustered.df, mqu =c(0.99,0.99,0.99))
#Without date as first column
S22.GPD<-Migpd_Fit(Data=S22.Detrend.Declustered.df[,-1], mqu =c(0.99,0.99,0.99))
```

NOAA_SLR *NOAA sea-level rise scenarios*

Description

Time (in years) for a specified amount of sea-level rise (SLR) to occur at Miami Beach according to the five SLR scenarios in NOAA 2017 report titled "Global and Regional Sea Level Rise Scenarios for the United States".

Usage

```
NOAA_SLR(OsWL_req, SLR_scen = c("High", "Intermediate", "Low"),
  Input_unit = "m", Year.Inital = 2020)
```

Arguments

OsWL_req	Numeric vector of SLR required.
SLR_scen	Character vector specifying which of the NOAA (2017) scenarios to consider. Options include High, Intermediate high Int.High, Intermediate, Intermediate low (Int.Low) and Low.
Input_unit	Character vector of length one; specifying units of SLR. Default is meters "m", other option is feet "ft".
Year	Character vector of length one; specifying

Value

List comprising the specified Threshold as the quantile of the conditioning variable above which declustered excesses are paired with co-occurrences of the other variable, the resulting two-dimensional sample data and name of the conditioning variable.

Examples

```
NOAA_SLR<-function(OsWL_req=seq(0,1,0.01),SLR_scen = c("High","Intermediate","Low"),Input_unit="m")
```

SLR_Scenarios *Sea level rise scenarios in the Southeast Florida Regional Climate Change Compact:*

Description

Calculates and plots time required for sea level rise to reach a specified level according to the three scenarios in the Compact.

Usage

```
SLR_Scenarios(SeaLevelRise, Unit = "m")
```

Arguments

SeaLevelRise	Numeric vector of length one, sea level rise required.
data	A data frame with n columns, each comprising a declustered and if necessary detrended time series to be modelled.

Value

An object of class "migpd". There are coef, print, plot, ggplot and summary functions available.

Examples

```
SLRScenarios(0.45)
```

Standard_Copula_Fit   *Fit an Archimedean/elliptic copula model - Fit*

Description

Fit a n-dimensional Archimedean or elliptic copula model. Function is simply a repackaging of the fitCopula function in the copula package.

Usage

```
Standard_Copula_Fit(Data, Copula_Type = "Gaussian")
```

Arguments

Data	Data frame containing n at least partially concurrent time series. First column may be a "Date" object. Can be Dataframe_Combine output.
Copula_Type	Type of elliptical copula to be fitted, options are "Gaussian" (Default), "tcopula", "Gumbel", "Clayton" and "Frank".

Value

List comprising the Copula_Type and the fitted copula Model object.

See Also

[Dataframe_Combine](#) [Standard_Copula_Sel](#) [CDVineCopSelect](#) [BiCopSelect](#)

Examples

```
cop<-Standard_Copula_Fit(Data=S20.Detrend.df,Copula_Type="Gaussian")
cop<-Standard_Copula_Fit(Data=S20.Detrend.df,Copula_Type="tcopula")
cop<-Standard_Copula_Fit(Data=S20.Detrend.df,Copula_Type="Gumbel")
cop<-Standard_Copula_Fit(Data=S20.Detrend.df,Copula_Type="Clayton")
cop<-Standard_Copula_Fit(Data=S20.Detrend.df,Copula_Type="Frank")
```

Standard_Copula_Sel   *Selecting best fitting standard (elliptical and Archimedean) copula*

Description

Fits five n-dimensional standard copula to a dataset and returns their corresponding AIC values.

Usage

```
Standard_Copula_Sel(Data)
```

Arguments

Data   Data frame containing n at least partially concurrent time series, detrended if necessary. Time steps must be equally spaced, with missing values assigned NA. First object may be a "Date" object. Can be Dataframe_Combine output.

Value

Data frame containing copula name in column 1 and associated AIC in column 2. Parameters are estimated using the fitCopula() function in copula package using maximum pseudo-likelihood estimator "mpl". See fitCopula for a more thorough explanation.

See Also

Dataframe_Combine Standard_Copula_Fit

Examples

Standard_Copula_Sel(Data_Detrend=S20.Detrend.df)
```

Standard_Copula_Sim   *Archimedean/elliptic copula model - Simulation*

Description

Simulating from a fitted Archimedean or elliptic copula model.

Usage

```
Standard_Copula_Sim(Data, Marginals, Copula, mu = 365.25, N = 10000)
```

Arguments

Data	Data frame containing n at least partially concurrent time series. First column may be a "Date" object. Can be Dataframe_Combine output.
Marginals	An migpd object containing the n-independent generalized Pareto models.
Copula	An Archimedean or elliptic copula model. Can be specified as an Standard_Copula_Fit object.
mu	(average) Number of events per year. Numeric vector of length one. Default is 365.25, daily data.
N	Number of years worth of extremes to be simulated. Numeric vector of length one. Default 10,000 (years).

Value

Each n-dimensional realisation is given on the transformed [0,1]^n scale (first n columns) in the first data frame u.Sim and on the original scale in the second data frame x.Sim.

Examples

```
#Fitting multiple independent GPDs to the data
#(required to transform realisation back to origional scale)
S20.Migpd<-Migpd_Fit(Data=S20.Detrend.Declustered.df[,-1],mqu=c(0.975,0.975,0.9676))
#Fitting Gaussian copula
Standard_Copula_Sim(Data=S20.Detrend.df,Marginals=S20.Migpd,Copula=S20.Gaussian,
                    mu=365.25,N=10000)
```

Vine_Copula_Fit   *C and D-vine Copula - Fitting*

Description

Fit either a C- or D-vine copula model. Function is a repackaging of the CDVineCopSelect function in the CDVine package.

Usage

```
Vine_Copula_Fit(Data, FamilySet = NA, Type = "DVine",
  SelCrit = "AIC", Indeptest = FALSE, Level = 0.05)
```

Arguments

Data	Data frame containing n at least partially concurrent time series. First column may be a "Date" object. Can be Dataframe_Combine output.
FamilySet	Integer vector which must include at least one pair-copula family that allows for positive and one that allows for negative dependence. If familyset = NA (default), selection among all possible families is performed. The coding of pair-copula families is shown below. See help file of the CDVineSim function to find the integers representing the different copula families.

Type	Type of the vine model:

- 1 or "CVine" = C-vine
- 2 or "DVine" = D-vine

SelCrit	Character vector specifying the criterion for choosing among the competing pair-copula. Possible choices: "AIC" (default) or "BIC".
Indeptest	Logical; whether a hypothesis test for the independence of u1 and u2 is performed before bivariate copula selection (default: Indeptest = FALSE; cp. BiCopIndTest). The independence copula is chosen for a (conditional) pair if the null hypothesis of independence cannot be rejected.
level	Numeric; significance level of the independence test (default: level = 0.05).

Value

List comprising the pair-copula families composing the C- or D-vine copula Family, its parameters Par and Par2 as well as whether it is a C or D-vine Type.

Examples

```
S20.Vine<-Vine_Copula_Fit(Data=S20.Detrend.df, FamilySet=NA,
                          Type="DVine", SelCrit="AIC",
                          Indeptest=FALSE, Level=0.05)
```

Vine_Copula_Sim	*C and D-vine Copula - Simulation*

Description

Simulating from specified C- and D-vine copula models. Builds on the CDVineSim in CDVine.

Usage

```
Vine_Copula_Sim(Data, Marginals, Vine_family, Vine_par, Vine_par2,
  Vine_Type = "DVine", mu = 365.25, N = 10000)
```

Arguments

Data	Data frame containing n at least partially concurrent time series. First column may be a "Date" object. Can be Dataframe_Combine output.
Marginals	An migpd object containing the d-independent generalized Pareto models.
Vine_family	A n*(n-1)/2 integer vector specifying the pair-copula families defining the fitting C- or a D-vine copula models. Can be specified as the Family argument of a Vine_Copula_Fit object. See help file of the CDVineSim function to find the integers representing the different copula families.
Vine_par	A n*(n-1)/2 vector of pair-copula parameters.
Vine_par2	A n*(n-1)/2 vector of second parameters for pair-copula families with two parameters.

Vine_Type   Type of the vine model:

                            • 1 or "CVine" = C-vine

                            • 2 or "DVine" = D-vine

                  Can be specified as the `Type` argument of a `Vine_Copula_Fit` object.

mu   (average) Number of events per year. Numeric vector of length one. Default is 365.25, daily data.

N   Number of years worth of extremes to be simulated. Numeric vector of length one. Default 10,000 (years).

Value

List comprising an integer vector specifying the pair-copula families composing the C- or D-vine copula `Vine_family`, its parameters `Vine_par` and `Vine_par2` and type of regular vine `Vine_Type`. In addition, data frames of the simulated observations: `u.Sim` on the transformed $[0,1]^n$ and `x.Sim` the original scales.
